SX1511B/SX1512B

World's Lowest Voltage Level Shifting GPIO with LED Driver and Keypad Engine

GENERAL DESCRIPTION

The SX1511B and SX1512B are complete ultra low voltage General Purpose parallel Input/Output (GPIO) expanders ideal for low power handheld battery powered equipment. This family of GPIOs comes in 8-, 16-channel configuration and allows easy serial expansion of I/O through a standard SPI interface. GPIO devices can provide additional control and monitoring when the microcontroller or chipset has insufficient I/O ports, or in systems where serial communication and control from a remote location is advantageous.

These devices can also act as a level shifter to connect a microcontroller running at one voltage level to a component running at a different voltage level, thus eliminating the need for extra level translating circuits. The core is operating as low as 1.425V while the dual I/O banks can operate between 1.2V and 3.6V independent of the core voltage and each other (5.5V tolerant).

The SX1511B and SX1512B feature a fully programmable LED Driver with internal oscillator for enhanced lighting control such as intensity (via 256-step PWM), blinking and breathing (fade in/out) make them highly versatile for a wide range of LED applications.

In addition, keypad applications are also supported with an on-chip scanning engine that enables continuous keypad monitoring up to 64 keys without any additional host interaction reducing the bus activity.

The SX1511B and SX1512B have the ability to generate mask-programmable interrupts based on a falling/rising edge of any of its GPIO lines. A dedicated pin (NINT) indicates to a host controller that a state change occurred on one or more of the lines. Each GPIO is programmable via a bank of 8-bit configuration registers that include data, direction, pull-up/pull-down, interrupt mask and interrupt registers. These I/O expanders feature small footprint packages and are rated from -40°C to +85°C temperature range.

KEY PRODUCT FEATURES

- 1.2V to 3.6V Low Operating Voltage with Dual Independent I/O Rails (VCC1, VCC2)
 - Enable Direct Level Shifting Between I/O Banks and Host Controller
- 5.5V Tolerant I/Os, Up to 15mA Output Sink on all I/Os (No Total Sink Current Limit)
- Integrated LED Driver for Enhanced Lighting
 - Intensity Control (256-step PWM)
 - Blink Control (224 On/Off values)
 - Breathing Control (224 Fade In/Out values)
- On-Chip Keypad Scanning Engine
 - Support Up to 8x8 Matrix (64 Keys)
 - Configurable Input Debouncer
- 8/16 Channels of True Bi-directional Style I/O
 - Programmable Pull-up/Pull-down
 - Push/Pull or Open-drain outputs
 - Programmable Polarity
- Open Drain Active Low Interrupt Output (NINT)
 - Bit Maskable
 - Programmable Edge Sensitivity
- Built-in Clock Management (Internal 2MHz Oscillator/External Clock Input, 7 clock values)
 - OSCIO can be Configured as GPO
- SPI Compatible Slave Interface (up to 20MHz)
- Power-On Reset and Reset Input (NRESET)
- Ultra Low Current Consumption: 1uA Typ
- -40°C to +85°C Operating Temperature Range
- Up to 2kV HBM ESD Protection
- Small Footprint Packages
- Pb & Halogen Free, RoHS/WEEE compliant

TYPICAL APPLICATIONS

- Cell phones, PDAs, MP3 players
- Digital camera, Notebooks, GPS Units
- Any battery powered equipment

(4) f_{SCK} is calculated assuming a $t_{SO,VALID}$ of maximum 1/3 of SCK cycle. This gives 1/6 of SCK cycle as setup time to the host controller. For systems where the setup time can be relaxed, $t_{SO,VALID}$ is also shown in §3 to allow the user to calculate the maximum SPI frequency for individual systems.

4.3 Reset

4.3.1 Hardware (NRESET)

The SX1511B and SX1512B generate their own power on reset signal after a power supply is connected to the VDDM pin. NRESET input pin can be used to reset the chip anytime, it must be connected to VDDM (or greater) either directly (if not used), or via a resistor.

Figure 6 – Power-On / Brown-out Reset Conditions

1. Device behavior is undefined until VDDM rises above VPOR, at which point internal reset procedure is started.
2. After t_{RESET} , the reset procedure is completed.
3. In operation, the SX1511B and SX1512B may be reset (POR like or LED driver counters only depending on RegMisc setting) at anytime by an external device driving NRESET low for t_{PULSE} or longer. Chip can be accessed normally again after NRESET rising edge.
4. During a brown-out event, if VDDM drops above VDROPH a reset will not occur.
5. During a brown-out event, if VDDM drops between VDROPH and VDROPL a reset may occur.
6. During a brown-out event, if VDDM drops below VDROPL a reset will occur next time VPOR is crossed.

Please note that a brown-out event is defined as a transient event on VDDM. If VDDM is attached to a battery, then the gradual decay of the battery voltage will not be interpreted as a brown-out event. Please also note that a sharp rise in VDDM ($> 1\text{V}/\mu\text{s}$) may induce a circuit reset.

4.3.2 Software (RegReset)

Writing consecutively 0x12 and 0x34 to RegReset register will reset all registers to their default values.

4.4 SPI Interface

The SX1511B and SX1512B SPI interface operates only in slave mode. 4 lines are used to exchange data between an external master host and the slave device:

- **NSS** : Slave select input (active low)
- **SCK** : Clock input
- **SI** : Data input
- **SO** : Data output

The SX1511B and SX1512B have a few user-accessible internal 8-bits registers to set the various parameters of operation (Cf. §5 for detailed configuration registers description). The SPI interface has been designed for program flexibility, in that any register can be written or read independently of each other.

ADVANCED COMMUNICATIONS & SENSING

4.4.1 WRITE

To write a value into a configuration register the timing diagram below should be carefully followed by the uC.

Figure 7 - SPI Write Operation

Successive register data can be written by the master without repeating the address byte, the register address can be automatically incremented or kept fixed depending on the setting programmed in RegMisc.

4.4.2 READ

To read a value from a configuration register the timing diagram below should be carefully followed by the uC.

Figure 8 – SPI Read Operation

Successive register data can be read by the master without repeating the address byte, the register address will be automatically incremented or kept fixed depending on the setting programmed in RegMisc.

4.5 I/O Banks

4.5.1 Input Debouncer

Each input can be individually debounced by setting corresponding bits in RegDebounce register. At power up the debounce function is disabled. After enabling the debouncer, the change of the input value is accepted only if the input value is identical at two consecutive sampling times.

The debounce time common to all IOs can be set in RegDebounceConfig register from 0.5 to 64ms.(fOSC = 2MHz)

4.5.2 Keypad Scanning Engine

SX1511B, and SX1512B integrate a fully programmable keypad scanning engine to implement keypad applications up to 8x8 matrix (i.e. 64 keys).

Please note that SX1512B also implements an Auto Sleep/Wakeup feature to save power consumption when no key has been pressed for a programmed time.

ADVANCED COMMUNICATIONS & SENSING

Figure 9 – 4x4 Keypad Connection to SX1511B

Following procedure should be implemented on the host controller for a 4x4 keypad:

1. Set *RegDir* to *0xF0* (*IO[3-0]* as outputs, *IO[7-4]* as inputs) , set *RegOpenDrain* to *0x0F* (*IO[3-0]* as open-drain outputs), set *RegPullup* to *0xF0* (pull-ups enabled on inputs *IO[7-4]*).
2. Enable and configure debouncing on *IO[7-4]* (*RegDebounceEnable* = *0xF0*, Ex : *RegDebounceConfig* = *0x05*)
3. Enable and configure keypad scanning engine (Ex : *RegKeyConfig* = *0x7D*) This will start an infinite loop with the following sequence to *IO[3:0]*: *ZZZ0*, *ZZ0Z*, *Z0ZZ*, *0ZZZ*. Make sure that scan interval is set to higher value than the debounce time.
4. When a key is pressed, *NINT* goes low, key scan is halted and the key coordinates are stored in *RegKeyData*:
 - The column data will be stored in *RegKeyData[7:4]* (Note: column indication is active low)
 - The row data will be stored in *RegKeyData[3:0]* (Note: row indication is active low)
 - When *RegKeyData* is read, this data along with the interrupt is automatically cleared (same behavior as reading *RegData*) and the key scan continues to the next row.
5. Restart from point 4.

This implementation allows the host to handle both single and multi-touches easily (fast AAAAAA sequence is a long press of key A, fast ABABABAB sequence is key A and key B pressed together, etc)

4.5.3 Level Shifter

Because of their 5.5V tolerant I/O banks with independent supply voltages between 1.2V and 3.6V, the SX1511B and SX1512B can perform level shifting of signals from one I/O bank to another **without uC activity** by programming the corresponding configuration register bits accordingly in *RegLevelShifter* (and *RegDir*). This can save significant BOM cost in a final application where only a few signals need to be level-shifted (no need for an additional external level shifter IC).

Figure 10 – Level Shifting Example

ADVANCED COMMUNICATIONS & SENSING

The minimum pulse width $t_{LevelShiftMin}$ which can be level shifted properly depends on $VCCx$ and $VDDM$:

$$t_{LevelShiftMin} = Input\ Delay + Core\ Delay + Output\ Delay$$

Input/Core/Output delays vs $VCCx/VDDM$ are given in figures below.

Figure 11 – Level Shifter Max Frequency Calculation Data

4.5.4 Polarity Inverter

Each IO's polarity can be individually inverted by setting corresponding bit in RegPolarity register. Please note that polarity inversion can also be combined with level shifting feature.

4.6 Interrupt (NINT)

At start-up, the transition detection logic is reset, and NINT is released to a high-impedance state. The interrupt mask register is set to 0xFF, disabling the interrupt output for transitions on all I/O ports. The transition flags are cleared to indicate no data changes.

An interrupt NINT can be generated on any programmed combination of I/Os rising and/or falling edges through the RegInterruptMask and RegSense registers. If needed, the I/Os which triggered the interrupt can then be identified by reading RegInterruptSource register.

ADVANCED COMMUNICATIONS & SENSING

When NINT is low (i.e. interrupt occurred), it can be reset back high (i.e. cleared) by writing 0xFF in RegInterruptSource (this will also clear corresponding bits in RegEventStatus register). The interrupt can also be cleared automatically when reading RegData register (Cf. RegMisc)

Example: We want to detect rising edge of I/O[1] on SX1511B (NINT will go low).

1. We enable interrupt on I/O[1] in RegInterruptMask
 ⇒ RegInterruptMask = "XXXXXX0X"
2. We set edge sense for I/O[1] in RegSense
 ⇒ RegSenseLow = "XXXX01XX"

Please note that independently from the "user defined" process described above the keypad engine, when enabled, also uses NINT to indicate a key press.

Hence we have NINT = "user defined condition occurred" OR "keypad engine condition occurred"

4.7 Clock Management

A main oscillator clock fOSC is needed by the LED driver, keypad engine and debounce features.

Clock management block is illustrated in figure below.

Figure 12 – Clock Management Overview

The block is configured in register RegClock (Cf §5 for more detailed information):

- Selection of internal clock source: none (OFF) or internal oscillator or external clock input from OSCIN.
- Definition of OSCIO pin function (OSCIN or OSCOUT)
- OSCOUT frequency setting (sub-multiple of fOSC)

Please note that if needed the OSCOUT feature can be used as an additional GPO (Cf. RegClock)

4.8 LED Driver

4.8.1 Overview

Every IO has its own independent LED driver (Cf §6.2 for typical LED connection), all IOs can perform intensity control (PWM) while some of them additionally include blinking and breathing features (Cf pin description §1.3)

The LED drivers of all I/Os share the same clock ClkX configurable in RegMisc[6:4]. Please note that for power consumption reasons ClkX is OFF by default.

Assuming ClkX is not OFF, LED driver for IO[X] is enabled when RegLEDDriverEnable[X] = 1 in which case it can operate in one of the three modes below:

- Static mode (all I/Os, with or without fade in/out)
- Single shot mode (blinking capable I/Os only, with or without fade in/out)
- Blink mode (blinking capable I/Os only, with or without fade in/out)

ADVANCED COMMUNICATIONS & SENSING

Figure 13 – LED Driver Overview

Each IO[X] has its own set of programmable registers (Cf §5 for more detailed information):

- **RegTOnX** (blinking capable I/Os only): TOnX, ON time of IO[X]
- **RegIOonX** (all I/Os): IOonX, ON intensity of IO[X]
- **RegOffX** (blinking capable I/Os only): TOffX and IOoffX, OFF time and intensity of IO[X]
- **RegTRiseX**(breathing capable I/Os only): TRiseX, fade in time of IO[X]
- **RegTFallX**(breathing capable I/Os only): TFallX, fade out time of IO[X]

Please note that the LED Driver mode is selectable for each IO bank between linear and logarithmic. (Cf 4.8.5)

All the figures assume normal IO polarity, for inverse polarity RegData control must be inverted (does not invert the polarity of the IO signal itself).

4.8.2 Static Mode

Only mode available for non blinking capable IOs (with Off intensity = 0), else invoked when TOnX = 0. If the I/O doesn't support fading the LED intensity will step directly to the IOonX/IOoffX value.

Figure 14 – LED Driver Static Mode

4.8.3 Single Shot Mode

Invoked when TOnX != 0 and TOffX = 0.

If the I/O doesn't support fading the LED intensity will step directly to the IOonX/IOoffX value.

ADVANCED COMMUNICATIONS & SENSING

4.8.4 Blink Mode

Invoked when TOnX != 0 and TOffX != 0.

If the I/O doesn't support fading the LED intensity will step directly to the IOnX/IOffX value.

Figure 16 – LED Driver Blink Mode

4.8.5 LED Driver Modes

For each IO bank, the LED driver mode of fading capable IOs can be selected between linear or logarithmic in RegMisc.

4.8.6 Synchronization of LED Drivers across several ICs

When several GPIO expanders are used in the same application it may be useful that their LEDs drivers are synchronous for coherent global operation.

In this case all ICs should share their fOSC through their OSCIO pins and have their reset connected together.

When RegMisc of each IC is set accordingly, NRESET signal can then be used to reset all devices' internal counters (but not the register settings) and allow synchronous LED operation (blinking, fading) across multiple devices.

4.8.7 Tutorial

Below are the steps required to use the LED driver with the typical LED connection described §6.2:

- Disable input buffer (RegInputDisable)
- Disable pull-up (RegPullUp)
- Enable open drain (RegOpenDrain)

ADVANCED COMMUNICATIONS & SENSING

- Set direction to output (RegDir) – by default RegData is set high => LED OFF
- Enable oscillator (RegClock)
- Configure LED driver clock and mode if relevant (RegMisc)
- Enable LED driver operation (RegLEDDriverEnable)
- Configure LED driver parameters (RegTOn, RegIOn, RegOff, RegTRise, RegTFall)
- Set RegData bit low => LED driver started

6 APPLICATION INFORMATION

6.1 Typical Application Circuit

Figure 18 - Typical Application Schematic

6.2 Typical LED Connection

Typical LED Connection is described below. The LED is usually connected to a high voltage (VBAT) to take advantage of the high sink current of the I/O and to accommodate high LED threshold voltages (VLED).

Please note that in this configuration the IO must be programmed as open drain output (RegOpenDrain) with no pull-up (RegPullUp) and input buffer must be disabled (RegInputBufferDisable).

VCCx can take any value without compromising LED operation.

¹LED colour/technology dependent

Figure 19 – Typical LED Operation

Serial R must be calculated for IOL not to exceed its max spec (Cf. Table 5) else VOL will increase.

8 SOLDERING PROFILE

The soldering reflow profile for the SX1511B and SX1512B is described in the standard IPC/JEDEC J-STD-020C. For detailed information please go to <http://www.jedec.org/download/search/jstd020c.pdf>

Profile Feature	Sn-Pb Eutectic Assembly	Pb-Free Assembly
Average Ramp-Up Rate (Ts _{max} to Tp)	3 °C/second max.	3° C/second max.
Preheat		
- Temperature Min (Ts _{min})	100 °C	150 °C
- Temperature Max (Ts _{max})	150 °C	200 °C
- Time (ts _{min} to ts _{max})	60-120 seconds	60-180 seconds
Time maintained above:		
- Temperature (T _L)	183 °C	217 °C
- Time (t _L)	60-150 seconds	60-150 seconds
Peak/Classification Temperature (Tp)	See Table 4.1	See Table 4.2
Time within 5 °C of actual Peak Temperature (tp)	10-30 seconds	20-40 seconds
Ramp-Down Rate	6 °C/second max.	6 °C/second max.
Time 25 °C to Peak Temperature	6 minutes max.	8 minutes max.

Note 1: All temperatures refer to topside of the package, measured on the package body surface.
